

# GRAF — Governance Readiness & Assurance Framework (Public)

Africa Governance & Civic Innovation Hub (AGCIH) | v1.0 | January 2026

## Purpose

GRAF is a practical framework that helps public institutions move from AI ambition to responsible, trusted implementation by defining minimum governance requirements, oversight pathways, and assurance controls for high-impact digital and AI-enabled public systems.

## The 5 GRAF Pillars

### 1) Governance & Mandates

Clarify authority, decision rights, accountability, and oversight responsibilities.

### 2) Risk & Impact Controls

Classify use cases and apply proportional safeguards before deployment and scale.

### 3) Operational Assurance

Monitoring, audit trails, performance checks, and escalation pathways in live systems.

### 4) Public Trust & Remedy

Transparency, complaints handling, review mechanisms, and accessible redress.

### 5) Implementation Readiness

People, roles, SOPs, procurement readiness, and coordination for safe delivery.

## What GRAF Produces (Outputs)

- Readiness baseline and governance design recommendations
- Clear roles, decision rights, and approval checkpoints
- Minimum viable controls for safe deployment and scaling
- Oversight and escalation pathways (including incident response triggers)
- Monitoring and assurance checklist (audit trail requirements)
- Public trust controls: transparency, complaints, review and remedy

## How Ministries Can Use GRAF (Public Guidance)

- Apply GRAF during procurement planning to prevent governance gaps before purchase.
- Use the pillars to assign ownership: policy, system, risk, and oversight responsibilities.
- Adopt minimum controls proportional to risk level (especially for high-impact decisions).
- Establish visible public trust mechanisms: reporting channels, escalation, and redress.
- Treat pilots and sandboxes as governance tests: audit trail, thresholds, and exit criteria.
